Practical Guide to SAP® Transportation Management (TM)

Anette Götz & Tobias Götz

Second, Extended Edition

- Comprehensive Overview of All Processes Enabled by SAP TM
- Configuration Best Practices for All Modes of Transport
- Tips on Integration with SAP ERP, EWM, GTS, EH&S, EM
# Table of Contents

**Preface**

1 **End-to-end transportation processes enabled by SAP Transportation Management, including document flow**
   1.1 Truck transportation  
   1.2 Ocean shipping  
   1.3 Air freight  
   1.4 Intermodal rail freight  
   1.5 Courier express parcel shipments  
   1.6 Conclusion

2 **SAP TM solution highlights and best practices**
   2.1 Creating and managing transportation requirements  
   2.2 Transportation capacity management  
   2.3 Manual and automated transportation planning  
   2.4 Subcontracting and tendering  
   2.5 Warehouse integration  
   2.6 Transportation execution and real-time track and trace  
   2.7 International shipping and customs services  
   2.8 Dangerous goods handling and 1,000 points rule  
   2.9 Calculation and settlement of transportation charges  
   2.10 Summary

3 **Key innovations with SAP TM 9.2**
   3.1 Fleet planning with a Gantt chart  
   3.2 Container management, planning, and optimization  
   3.3 Load optimization enhancements  
   3.4 Collaboration portal  
   3.5 Strategic freight procurement  
   3.6 Strategic freight selling

2 SAP TM solution highlights and best practices

In this chapter, we cover SAP TM’s key solution highlights for end-to-end transportation management. We start with transportation requirements and capacity management and then move on to planning and tendering capabilities. From there, we outline best practices for tracking and tracing, international shipping, and handling of dangerous goods. We conclude the chapter with specific information about charge calculation and settlement.

2.1 Creating and managing transportation requirements

The starting point of every transportation process is a request for transportation services. In this section, we take a look at the different options for creating transportation requirements in SAP TM.

Figure 2.1 depicts a simplified version of the general transportation planning document flow in SAP TM. Each process starts with a transportation requirement document which contains all relevant information on the requested transportation services, such as source and destination location, requested dates and times, business partners involved, cargo to be shipped, service level, and further terms and conditions. The transportation requirement is either created based on ERP documents (e.g., sales orders, purchase orders, or deliveries) or originates from other external sources. From the transportation requirement, one or multiple freight units are created that each represent a set of goods, e.g., a container or a pallet. The freight units are then planned on a freight order or booking, which is SAP TM's transportation execution document.
However, depending on the business scenario, there are different options for entering transportation requirements in SAP TM. For shippers, logistics processes are usually not part of their core business and are supporting processes only. Usually at these companies there is an ERP system in place that manages their core processes and already possesses information that is relevant for the transportation process. In this scenario, ERP transmits the relevant information from an order or delivery document to SAP TM, where a corresponding order-based transportation requirement (OTR) or delivery-based transportation requirement (DTR) is created automatically. As the ERP system is the leading information system, it is not allowed to make changes to the ERP-based transportation requirements in SAP TM. Updates are executed in the ERP system and are then instantly synchronized to SAP TM.

For logistics service providers (LSPs) or carriers, transportation services are part of their core business. Extensive information on the transportation demand is required and furthermore, there is no ERP system with predecessor business documents, such as sales orders, in place. Therefore, the transportation requirement is created directly in SAP TM. This transportation requirement type is called a forwarding order (FWO) in SAP TM.

Figure 2.2 summarizes the different document types used in SAP TM to represent a transportation requirement.

---

1 The relationship between transportation requirement, freight unit, and freight order/booking is not necessarily 1:1:1 but can take any form of x:y:z.
2.1.1 Integrating SAP ERP documents to create transportation requirements

Integrating SAP ERP orders

SAP TM can integrate the following SAP ERP order documents:

- Sales orders (SOs)
- Purchase orders (POs)
- Stock transfer orders (STOs)

For each order document that is transferred to SAP TM, one order-based transportation requirement (OTR) is automatically created in SAP TM. The ERP order items are listed as OTR items. As you can see in Figure 2.3, the OTR inherits all information from the ERP order that is relevant for the transportation process, e.g., source and destination location, business partners involved (such as the customer), transportation dates, and product information.

In the OTR’s DOCUMENT FLOW, the ERP predecessor sales order document is displayed with a hyperlink to link it directly to the ERP system (see Figure 2.4).
Figure 2.3: Order-based transportation requirement document

Figure 2.4: Document flow in OTR document
Technically, the communication to SAP TM is triggered via the output determination in SAP ERP. To integrate sales orders you have to create the new output type TRS0. Thereafter, you can activate the transfer of sales orders via the SAP Customizing Implementation Guide (IMG) menu path in SAP ERP: INTEGRATION WITH OTHER SAP COMPONENTS • TRANSPORTATION MANAGEMENT • ORDER INTEGRATION • ACTIVATE TRANSFER OF SALES DOCUMENTS.

Sales order integration

Using the following five attributes you can determine which sales orders should be transferred to SAP TM (see Figure 2.5):

- Sales organization
- Distribution channel
- Division
- Sales order type
- Shipping condition

![Change View "Sales Document Transfer": Overview](image)

Figure 2.5: Activating the transfer of sales orders

For a combination of the above-named attributes, you have to enter a control key that defines which documents to transfer to SAP TM and whether the sales order scheduling functionality should be used. The standard control keys are shown in Figure 2.6.
